

Group 31: An
interactive, 3D visual
reconstruction of a
whole *E. coli* cell

Rohan Grover, Winnie
Shi, Yuxuan Richard Xie

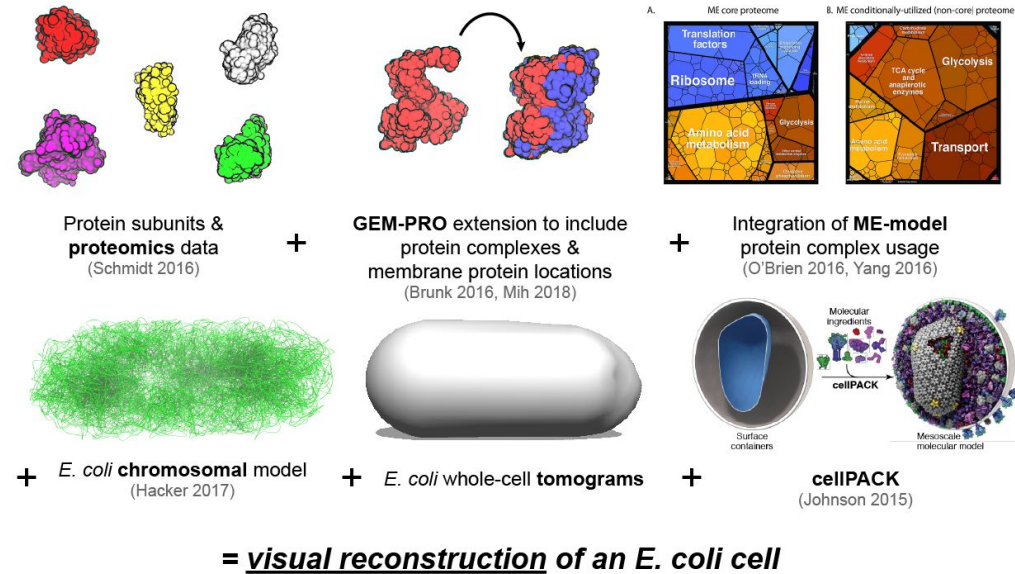

Whole Cell Models

- Help us understand:
 - Metabolic networks and expression networks
 - Relative concentrations and interactions of proteins
- Build more complex models in the future
- They are cool

Design Objectives

- Standardized pipelines for 3D reconstructions of *E. coli* and more
- Integrate high quality structural data along with:
 - Genomics
 - Proteomics
 - Metabolomics
- Interactive platform that enables easy search and manipulation

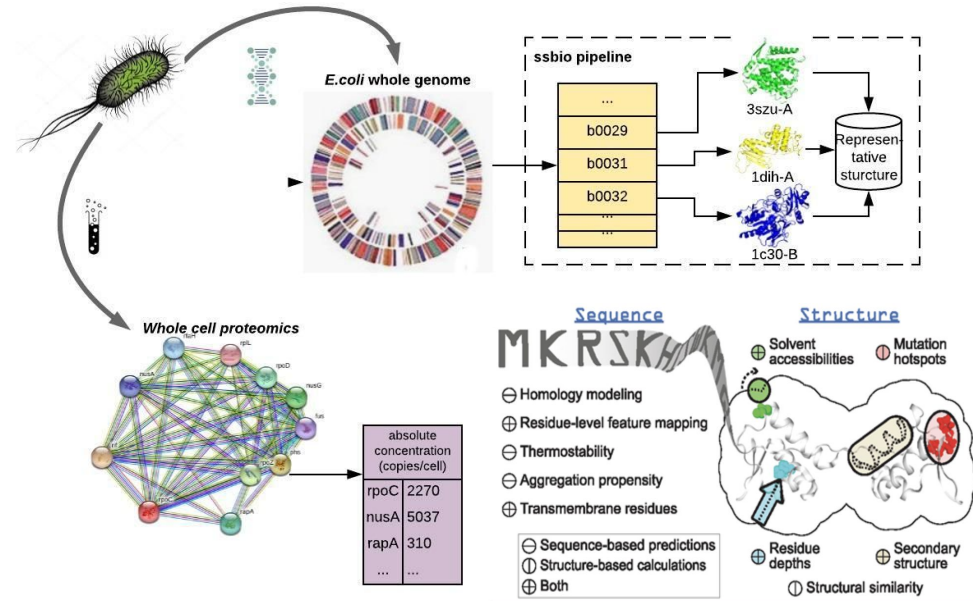

How do you curate
and build a whole cell
model of *E. coli*?

Prototype 1

Testing the feasibility of building
a whole cell model for *E. coli*

Proteins and Structures

- ssbio (Python framework for **structural systems biology**): calculate and map structural information at genome scale
- Experimental protein concentrations from literature
- Building a repository of high quality protein structures with extensive annotations

What's in prototype 1?

Not protein complexes, just the protein components themselves
(D, E in the figure, randomly distributed throughout the cell)

Protein

Structure

See:

- ▶ ssbio
- ▶ PDB
- ▶ Homology modeling

Proteomics measurements

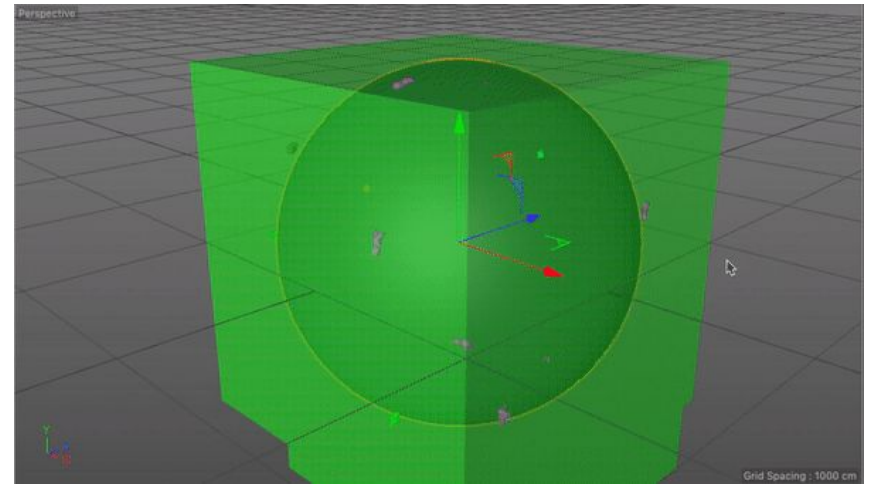

Copy number = 445

Concentration = Molarity =
 $(445 / \text{Avogadro's}) / \text{compartment_volume}$

Gene	UniProt	NAME	Description	PDB	Structure_source	MOLARITY	Copy number	LOCALIZATION	INCLUDE
b0001	P0AD86	thrL	thr operon leader peptide					Cytosol	
b0002	P00561	thrA	Bifunctional aspartokinase	b0002_1_462_3c20-A_clean	SWISS-MODEL	2.59E-06	4375	Cytosol	x

Integration Using cellPACK

Membranes

- Built a rough object of the *E. coli* inner and outer membranes from tomograms using IMOD
- Is not a whole cell
- Volume of cell in tomograms small compared to average sizes from literature
 - Dimensions: $\sim 1\mu\text{m} \times \sim 0.4\mu\text{m}$

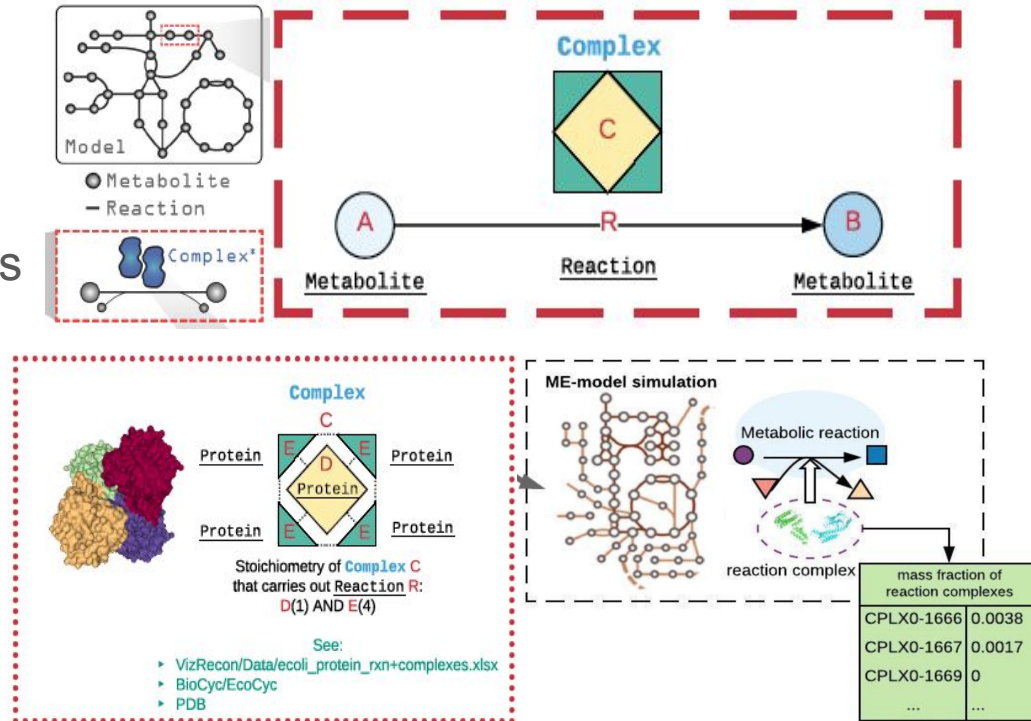

Prototype 2

A more complete representation of *E. coli* and final model for this senior design project

Addition of Complexes

- Macromolecule Expression model (ME-model) determines stoichiometry of complex structures
- Formation rate (flux) of these complexes are obtained by ME-model simulations
- Homology models used for unknown structures

Computation of Complex Copy Numbers

- Complex copy numbers were estimated using ME-model mass fraction ratios
- Copy Numbers were determined using these assumptions:
 1. Proteins want to be in complexes
 2. There is a “limiting” protein
- The “limiting protein” is arbitrarily chosen to best maximize total number of complexes made

Membrane Proteins and Complexes

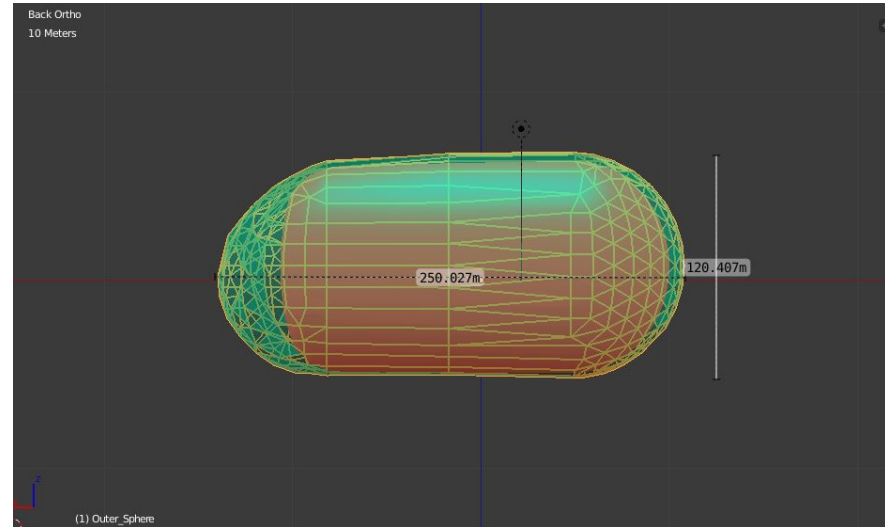

- cellPACK can pack membrane proteins by locking parameters
- Orientations of Proteins in Membranes (OPM) contains high-quality annotations for proteins
 - Alternatives: Transmembrane Helix Prediction using Hidden Markov Models (TMHMM), UniProt
- Lab member developed algorithm to confirm quality

FirstGlance in Jmol

Membrane Improvements

- Made “pill” from dimensions in literature
- Total Volume: $2.2\mu\text{m}^3$
- Drawbacks:
 - Periplasm Volume to whole cell volume: 19% (compared to 8% from experimental data)

Addition of Chromosome

- 500 base pairs per bead (bpb) model of an *E. coli* chromosome
- Mid-cell origin of replication
- Shared with us by William Hacker and Professor Adrian Elcock

Final “Menu” and Recipe

cellPACK

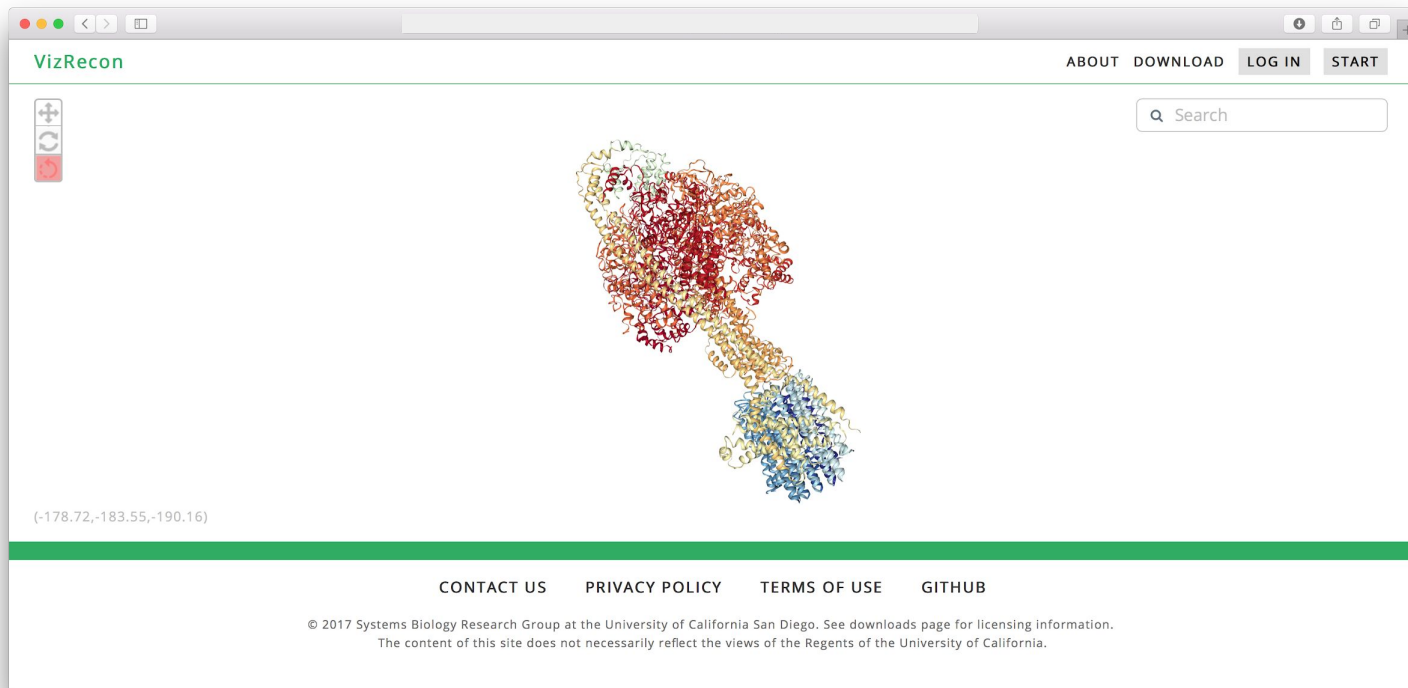

How do we display the
pipeline and model?

Integration of the components

Building an interactive platform

Conclusions and Future Goals

- Created pipeline to link structural and spatial info with “omics” data
- Able to generate appropriate complexes and membrane structures
- Still in progress of packing final model
- Working on finding an efficient way of displaying the model using NGL
- Improve the detail of visualization (i.e. interactions between components, more constraints for localizations, thermodynamics, kinetics, etc.)
- Update model to include more experimentally determined components
- Apply the pipeline and create reconstructions to other organisms
- Integrate metabolic networks to simulate directly on the 3D model with the aid of molecular dynamics (MD)
